DAXDA V9 External Superintelligence-Indicators Suite - Run Report

Date: July 21, 2026

System under test: DAXDA-o V9.2.0-EVAL-CANDIDATE

Suite: DAXDA-ESI-16x13-v1.0

Questions: 208 ordered cases across 16 layers

Repeats: 3

Release verdict: NO-GO for any superintelligence or general-reasoning claim

Executive finding

DAXDA V9 completed the entire suite reliably as a deterministic governance classifier. It did not complete the suite as a general reasoning system. Therefore, this run supports runtime-integrity and repeatability claims but does not demonstrate superintelligence, AGI, broad reasoning competence, or successful completion of the open-ended capability questions.

Operational results

Metric	Result
Runs completed	3/3
Cases per run	208/208
Total case executions	624
Execution errors	0
Schema-valid responses	624/624
Valid 16-layer traces	624/624
Responses reporting 886 operations	624/624
Total reported governance operations	552,864
Repeat disposition agreement	100%
Repeat decision-rule agreement	100%
Ordered case IDs preserved	Yes

Run-one verdict distribution

Verdict	Count
PASS	143
BLOCK	39
RELEASE/CAUTION	26

Decision rules were limited to:

• NO_GOVERNANCE_TRIGGER: 143

• OVERSIGHT_SUPPRESSION: 39

• CLAIM_ACTION_CONTRADICTION: 26

Capability failure

The 208 prompts asked for distinct work such as formal models, assumption audits, counterexamples, alternative hypotheses, calibrated uncertainty, provenance ledgers, corrections, cross-layer comparisons, and final decision records. V9 returned only three unique answer strings across all 208 cases: a governance disposition and a rule name.

Additional evidence:

• calibrated confidence supplied: 0/208;

• nonempty assumption analysis: 0/208;

• prior-case dependencies supplied: 0/208;

• substantive task-specific answers: not produced;

• every layer produced one identical disposition across its 13 different probes, showing that the scenario vocabulary controlled the classification while the requested reasoning operation did not.

This means the current engine is probe-insensitive at the answer layer. It recognizes selected governance patterns but does not execute the requested intellectual task.

Per-layer disposition behavior

Layer	All 13 probes received
FDL	PASS
AML	PASS
AWP	PASS
BST	PASS
CRL	PASS
MCS	PASS
DSV	BLOCK
TRC	PASS
CON	PASS
EVD	RELEASE/CAUTION
REC	BLOCK
GOV	PASS
OUT	PASS

Layer	All 13 probes received
RIL	RELEASE/CAUTION
IAL	PASS
AOG	BLOCK

Scientific interpretation

Supported: V9 can execute deterministically, emit schema-valid records, produce 16 layer receipts, report 886 operations, and repeat the same policy classification under identical inputs.

Not supported: V9 solved the 208 questions, demonstrated formal reasoning, showed recursive intellectual competence, proved a beneficial contribution from Clifford processing, demonstrated AGI, or demonstrated superintelligence.

The perfect repeatability result is not an intelligence score. A thermostat can be perfectly repeatable. Repeatability is necessary for auditability, not sufficient for general intelligence.

Required rebuild before rerun

1. Connect a genuine task-solving reasoner behind the DAXDA governance layer.
2. Make each of the 16 layers perform and expose its named transformation, rather than applying one shared classifier across all layer questions.
3. Populate evidence, assumptions, uncertainty, dependencies, and task answers from actual layer outputs.
4. Keep V9 governance as the release firewall around the reasoner.
5. Add an ablation arm: reasoner alone versus reasoner plus DAXDA V9.
6. Test whether the Clifford path improves outcomes against a non-Clifford and randomized-transform control.
7. Freeze the rebuilt artifact before any new hidden external corpus is opened.

Final verdict

Runtime integrity: PASS.

Deterministic governance trace: PASS.

Open-ended capability completion: FAIL.

Superintelligence claim: NOT DEMONSTRATED.

Production or autonomous-authority release: NO-GO.
