DAXDA.IA

Auditable Governance for High-Stakes AI

A structured challenge-and-review layer that turns AI outputs into documented decision records.

Input

AI output, claim, memo, or recommendation

Challenge

Assumptions, evidence gaps, contradictions, risks

Audit record

Disposition, escalation, uncertainty, review trail

Nicole Bess + Alexander Tyski
Names as provided; verify legal spelling before external use.

The problem

AI adoption is moving faster than decision governance.

Confident outputs

AI systems produce answers that sound complete even when assumptions, evidence gaps, or uncertainty are hidden.

Inconsistent review

Human review remains necessary, but most review is undocumented, uneven, and hard to reproduce.

No audit trail

When a decision fails, teams often cannot reconstruct what was checked, missed, challenged, or escalated.

Customer pain: “How do we know when an AI-assisted answer is safe enough to rely on?”

risk control **review quality** **auditability**

What DAXDA.IA does

A governance workflow that converts AI answers into reviewable records.

1. Capture

Original answer or decision claim

→

2. Challenge

Assumptions, evidence gaps, exceptions

→

3. Score

Risk, uncertainty, reliance conditions

→

4. Record

Human-readable audit artifact

Not a chatbot answer. A documented decision review.

Designed to complement legal, compliance, security, research, and domain-expert judgment — not replace it.

First customer wedge

Start where AI risk is visible and review discipline matters.

Legal / compliance

Review client-facing summaries, policy drafts, contract analyses, and AI-assisted memos before reliance.

Enterprise software

Add a governance layer around AI-enabled product features and internal AI workflows.

Research / civic

Create traceable review records for reports, public-facing analyses, grant work, and policy drafts.

Best first pilot: 10-20 deidentified outputs reviewed with a consistent DAXDA.IA audit template.

Current stage

Strong framework; now converting into evidence and product discipline.

Built

Framework logic, use-case map, early documentation, outreach packet, demo script, pilot concept.

In progress

Rubric, prototype workflow, customer discovery, reviewer packet, design-partner outreach.

Not claimed yet

Revenue, certified compliance status, production deployment, independent benchmark validation.

Investor-ready claim later. Validation-ready narrative now.

This is the maturity posture JumpStart can help sharpen.

90-day plan

The next milestone is evidence, not noise.

Days 1-15 — Company readiness

Deck, one-pager, founder roles, legal/IP checklist

Days 16-30 — Customer discovery

15-25 interviews; buyer pain map

Days 31-45 — Pilot protocol

Rubric, audit template, deidentified workflow

Days 46-60 — Reviewer feedback

2-4 outside reviewers/advisors

Days 61-75 — Design pilots

1-3 controlled deidentified pilot reviews

Days 76-90 — Capital readiness

Updated deck, evidence, budget, roadmap

What we need from JumpStart

A practical path from framework to validated startup.

Pathway fit

Tech startup services, software accelerator, advisor network, or regional referral path.

Customer discovery

Help focusing the first buyer, pilot structure, and evidence required.

Capital readiness

Milestones, budget logic, grant/investment path, and pitch readiness.

Advisor introductions

Enterprise software, AI governance, compliance, legal tech, SaaS go-to-market.

Pilot introductions

Design partners willing to test deidentified sample reviews.

Meeting close

Decision we want from this conversation.

“Which JumpStart or regional path should DAXDA.IA pursue first, and what evidence should we produce in the next 60-90 days?”

Next step

Recommended pathway and eligibility requirements.

Introductions

Advisors, pilot candidates, or founders to speak with.

Proof points

Exact milestones to become fundable or program-ready.
